A: AI can be used correctly in college by using it as a resource rather than depending on it to do assignments or any type of work. Using AI for studying is a good example of correctly using AI in college to help summarize and organize information to study. Using AI to generate ideas is another efficient use for college students because it can be a great tool to help brainstorm topics for projects, assignments, and essays. Using AI to help generate images and other tools with the permission of your professor is another correct use of AI in college. AI can be a great tool for college students if they utilize this resource correctly and understand their professors' rules for the use of AI in their course, instead of just depending on AI to do everything for them.

Does AI Agree?

Yes, I agree. Your main point is strong: **AI is most useful in college when it supports a student's learning rather than replacing their own work.**

I especially agree with your examples:

- 📚 **Studying:** summarizing and organizing material can make studying more effective.
- 💡 **Brainstorming:** AI can help students develop ideas without writing the entire assignment for them.
- 🎨 **Images and tools:** these can be appropriate when the professor allows them.
- 📋 **Following course policies:** this is probably the most important point because AI rules can differ between professors and courses.

The only thing I'd emphasize is that students should **check AI-generated information for accuracy** and make sure the final work reflects their own understanding.

B: AI is very easy to use incorrectly while in college because of its easy accessibility which is appealing to college students. Using AI to complete assignments and essays are two examples of using AI incorrectly. Soley focusing on AI to write papers and using information generated by them to put in your paper will lead to plagiarism. Using AI to answer questions on quizzes or tests is also incorrect ways to use this platform. Allowing AI to do things for you will lead to uncertainty and confusion when it comes down to having to preform tasks independently either in life or a career. College students who are depending on AI to do everything for them are severely hurting our future generations because they are not learning anything which will negatively impact them later on.

Does AI Agree?

Yes, I agree with your argument. I think your strongest point is that **depending too heavily on AI can prevent college students from developing the knowledge and skills they will need in the future**.

I also agree that using AI on assignments, quizzes, or tests when a professor does not allow it is an inappropriate use of AI. One small change I would make is saying that AI-generated information **can lead to plagiarism** rather than saying it will always lead to plagiarism, since plagiarism depends on how the information is used and cited.
